

Laboratory Report – Longitudinal Panels and Serology Summary

Department: NorthStar Community Laboratory Services
Document: Longitudinal Laboratory Compilation (Selected Results)
Coverage Period: 2021-07 to 2025-03
Prepared For: Internal Medicine / Primary Care Review
Status: Final (Synthetic test compilation)

****Report Type:**** Consolidated longitudinal laboratory and serology compilation for care■team review. This document consolidates selected key results referenced across outpatient visits and imaging follow-up. Individual source requisitions may exist externally.

****Hematology / Chemistry:**** CBCs across multiple dates are within reference ranges without persistent cytopenias. Renal function is preserved (creatinine reported 68 µmol/L with eGFR >120 on multiple occasions). Electrolytes remain within normal limits when measured.

****Inflammatory Markers:**** ESR is repeatedly within normal limits. ****CRP is intermittently elevated****, most recently rising to 9.1 mg/L on 2025■03■24 after a borderline value around 5 mg/L earlier in 2025. This pattern suggests a low■grade inflammatory signal but is nonspecific and should be interpreted alongside symptoms, physical exam, and imaging.

****Autoimmune Testing:**** Extensive rheumatologic screening is negative in 2025 (ANA, ENA panel including SSA/SSB/RNP/ScI■70/Jo■1, RF, dsDNA). Earlier ANA in 2021 was reported at 1:80, which may be at the upper limit of normal depending on lab methodology.

****Infectious Serologies / Microbiology:**** EBV IgG positive (prior exposure). HIV and HCV negative. Lyme tier■1 EIA negative. Stool studies negative for bacterial pathogens; Blastocystis detected without supportive symptom burden.

****Protein Studies:**** SPEP and quantitative immunoglobulins (IgG/IgA/IgM) are within normal limits; LDH within normal limits when checked.

****Nutritional / Endocrine:**** Vitamin D 25■OH is reported low; TSH and free T4 within normal limits; B12 and PTH within normal limits.

****Interpretive Note:**** In the context of persistent lymphadenopathy, the absence of cytopenias, normal LDH, and normal protein studies is reassuring but does not independently exclude all etiologies. Trend monitoring is reasonable.

Date	Test	Result	Ref	Flag
2021-11	ANA	1:80 speckled/homogeneous	≤1:80	Borderline
2021-12	LDH	Within normal limits	—	
2023-12-01	Creatinine	68 µmol/L	—	
2024-01	CBC	WNL (Hgb 162, Plt 212, WBC 7.1)	—	
2025-01	CRP	5.0 mg/L	<5.0	Borderline
2025-03-24	CRP	9.1 mg/L	<5.0	H
2025-01	ANA/ENA/RF/dsDNA	Negative	—	

2025-01	SPEP/Immunoglobulins	Within normal limits	—	
2025-01	Vitamin D (25■OH)	56.6 (low)	—	L

Addendum / Comparison and Administrative Notes

Comparison statements reflect the most recent prior studies available in the network at the time of reporting. If external imaging exists, formal comparison may be limited until images are imported. Clinicians are encouraged to interpret findings in the context of the patient's broader longitudinal record and to correlate with physical examination and symptoms.

Quality Assurance: This report was auto-formatted from a structured radiology/clinic template and reviewed for internal consistency. Minor variations in measurements may occur due to technique, probe position, and interpreter variability.
